# Turf and macroalgae productivity on coral reefs: a modelling exercise in Moorea

#### 2022-06-28

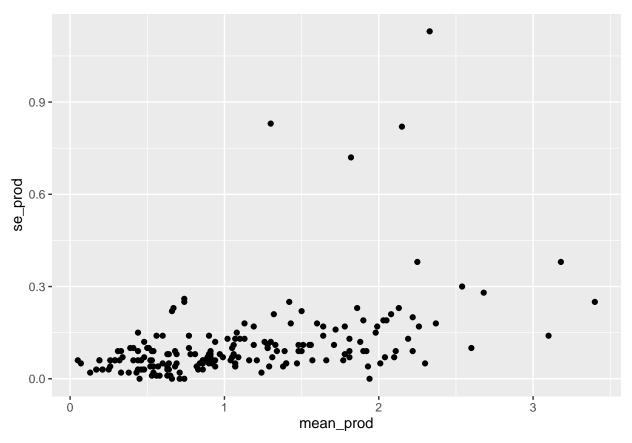

#### **Packages**

Loading data compiled and reworked by Tebbett and Bellwood 2021 Mar Env Res.

Depth data were added manually by looking at each individual study

```
data <- read_csv('turf_prod_val.csv') |>
 filter(!is.na(depth))
## Rows: 214 Columns: 4
## -- Column specification ------
## Delimiter: ","
## chr (3): mean_prod (g C m-2 day-1), obs, Ref
## dbl (1): depth
##
## i Use 'spec()' to retrieve the full column specification for this data.
## i Specify the column types or set 'show_col_types = FALSE' to quiet this message.
unit <- names(data)[1]</pre>
names(data)[1] <- 'prod'</pre>
x <- str split(data$prod, '\xb1')</pre>
data$mean_prod <- as.numeric(substr(unlist(lapply(x, function(x)x[1])),1,4))</pre>
data$se_prod <- as.numeric(substr(unlist(lapply(x, function(x)x[2])),2,5))</pre>
## Warning: NAs introduced by coercion
data <- data %>% filter(mean_prod != 0)
```

Now, for the data points we do not have standard error values, determine them from the relationship between mean and se:

## Predicting variability using the mean for 14 points and also adjusting McClure 2019, ## which is a ci and not se, and also adding a small non zero value to all zero se

```
mod_se <- lm(se_prod ~ mean_prod, data=data)
## Model sucks, but better than to consider zero

data[is.na(data$se_prod),'se_prod'] <- round(predict(mod_se, newdata=data[is.na(data$se_prod),]),2)
data[data$Ref == 'McClure 2019', 'se_prod'] <- data[data$Ref == 'McClure 2019', 'se_prod'] / 1.96
nzmin <- function(x) min(x[x>0])
data[data$se_prod == 0,'se_prod'] <- nzmin(data$se_prod)</pre>
```

And finally modelling algal turf productivity using a meta-analysis

Bayesian model with depth as the only predictor

Loading and tidying data to predict for

```
## Constrained max depth of site to 15m
pred_depth <- read.csv('moorea_depth.csv') %>%
```

```
mutate(site=tolower(site)) %>%
group_by(site) %>%
mutate(depth=if_else(depth < -15,-15, depth)*-1) %>%
slice_max(depth)

pred_data <- read.csv('moorea_benthos.csv') %>%
mutate(site=gsub('\\s','_',tolower(site)))
```

Filtering and manipulating the time series for the categories of interest.

For Moorea, at the moment, these could be algal turfs, halimeda and macroalgae

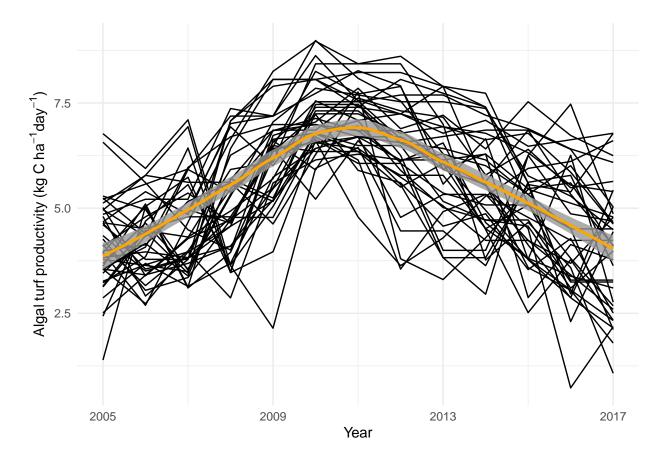

```
ts data <- left join(pred data, pred depth, by='site') %>%
  filter(Habitat=='Outer slope' & Season=='Mar') %>%
  mutate(subs_group=case_when(
      Substrate == 'Dead coral' ~ 'algal_turf',
      Substrate == 'Stegastes Turf' ~ 'algal_turf',
      Substrate == 'Rubble' ~ 'algal_turf',
      Substrate == 'Pavement' ~ 'algal_turf',
      Substrate == 'Macroalgae' ~ 'macroalgae',
      Substrate == 'Turbinaria' ~ 'macroalgae',
      Substrate == 'Halimeda' ~ 'halimeda',
      TRUE ~ Substrate,
  )) %>%
  filter(subs_group %in% c('algal_turf', 'macroalgae')) %>%
  group_by(Year, site, Transect, lat, long, depth, subs_group) %>%
  summarise(prop=sum(proportion), .groups='drop_last') %>%
  pivot wider(names from=subs group, values from=prop, values fill=0)
```

Now, how about trying to predict benthic reef productivity by merging area specific turf productivity predicted using the data compiled by Tebbett and Bellwood and turf cover?

```
## in kg C ha-1 day-1
```

## Now plotting

First the time series of turf productivity over time in Moorea

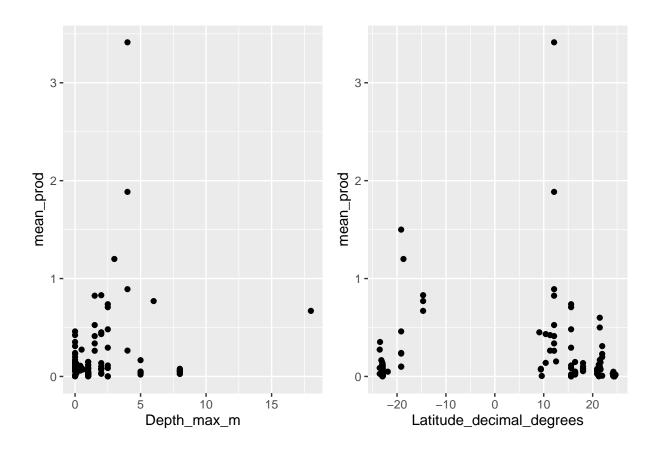

### And using Duarte's et al 2022's data to explore a model for macroalgae

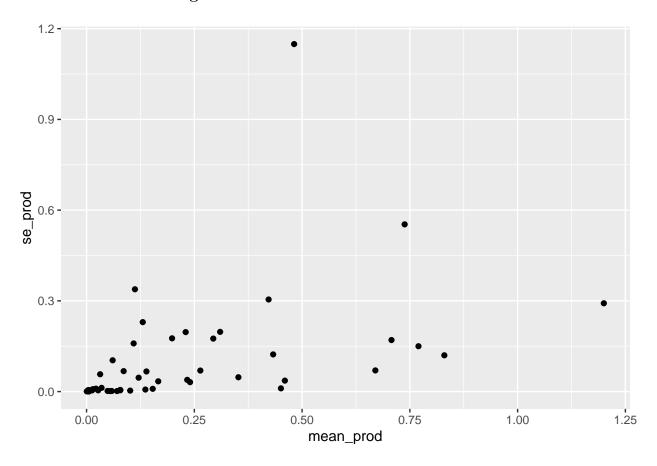

It could be possible to do the same for Halimeda, but there are less values

Maybe return to this possibility later?

## Warning: Removed 19 rows containing missing values (geom\_point).

Can we predict standard error values from a relationship between mean and se as we did for algal turfs?

```
mod_se2 <- lm(se_prod ~ mean_prod, data=dmachal)
## Again, Model sucks, but better than to consider zero
dmachal[is.na(dmachal$se_prod),'se_prod'] <- round(predict(mod_se2, newdata=dmachal[is.na(dmachal$se_prod)))</pre>
```

And finally modelling macroalgae productivity using a meta-analysis

Bayesian model with depth as the only predictor

```
family=skew_normal(),
             prior = pri2,
             chains = 4, iter = 5000, thin = 3)
