# Turf and macroalgae productivity on coral reefs: a modelling exercise in Moorea

2022-06-28

#### **Packages**

```
library(tidyverse)
library(brms)
library(tidybayes)
library(patchwork)
```

Loading data compiled and reworked by Tebbett and Bellwood 2021 Mar Env Res.

Depth data were added manually by looking at each individual study

```
data <- read_csv('turf_prod_val.csv') |>
    filter(!is.na(depth))

unit <- names(data)[1]
names(data)[1] <- 'prod'

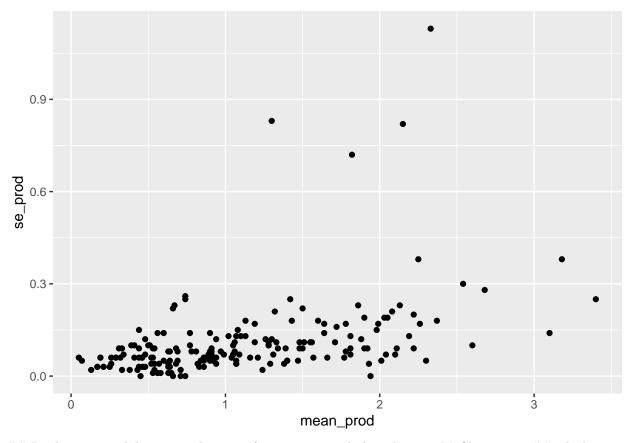

x <- str_split(data$prod, '\xb1')
data$mean_prod <- as.numeric(substr(unlist(lapply(x, function(x)x[1])),1,4))
data$se_prod <- as.numeric(substr(unlist(lapply(x, function(x)x[2])),2,5))

## Warning: NAs introduced by coercion</pre>
```

Now, for the data points we do not have standard error values, determine them from the relationship between mean and se:

data <- data %>% filter(mean\_prod != 0)

```
ggplot(data %>% filter(!is.na(se_prod))) +
  geom_point(aes(x=mean_prod,y=se_prod))
```

## Predicting variability using the mean for 14 points and also adjusting McClure 2019, ## which is a ci and not se, and also adding a small non zero value to all zero se

```
mod_se <- lm(se_prod ~ mean_prod, data=data)
## Model sucks, but better than to consider zero

data[is.na(data$se_prod),'se_prod'] <- round(predict(mod_se, newdata=data[is.na(data$se_prod),]),2)
data[data$Ref == 'McClure 2019', 'se_prod'] <- data[data$Ref == 'McClure 2019', 'se_prod'] / 1.96
nzmin <- function(x) min(x[x>0])
data[data$se_prod == 0,'se_prod'] <- nzmin(data$se_prod)</pre>
```

#### And finally modelling algal turf productivity using a meta-analysis

### Bayesian model with depth as the only predictor

```

                           0.681878 seconds (Sampling)
## Chain 4:
                           1.34964 seconds (Total)
## Chain 4:
saveRDS(brmod, 'turf_prod_brms.RDS')
```

#### Loading and tidying data to predict for

```
## Constrained max depth of site to 15m

pred_depth <- read.csv('moorea_depth.csv') %>%
    mutate(site=tolower(site)) %>%
    group_by(site) %>%
    mutate(depth=if_else(depth < -15,-15, depth)*-1) %>%
    slice_max(depth)

pred_data <- read.csv('moorea_benthos.csv') %>%
    mutate(site=gsub('\\s','_',tolower(site)))
```

Filtering and manipulating the time series for the categories of interest.

For Moorea, at the moment, these could be algal turfs, halimeda and macroalgae

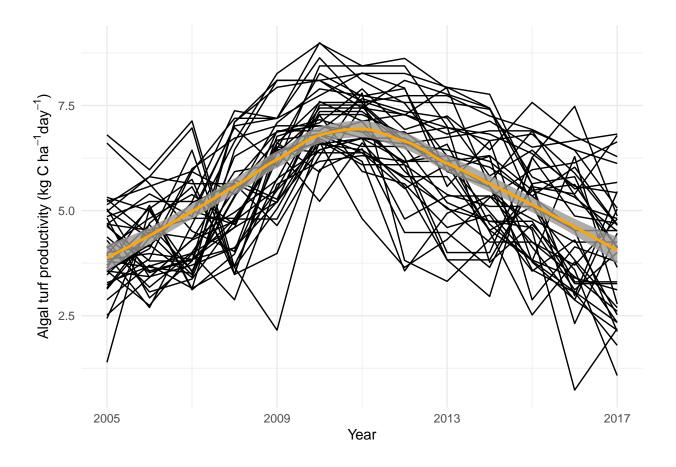

```
ts_data <- left_join(pred_data,pred_depth, by='site') %>%
filter(Habitat=='Outer slope' & Season=='Mar') %>%
mutate(subs_group=case_when(
    Substrate == 'Dead coral' ~ 'algal_turf',
    Substrate == 'Stegastes Turf' ~ 'algal_turf',
    Substrate == 'Rubble' ~ 'algal_turf',
    Substrate == 'Pavement' ~ 'algal_turf',
    Substrate == 'Macroalgae' ~ 'macroalgae',
```

```
Substrate == 'Turbinaria' ~ 'macroalgae',
   Substrate == 'Halimeda' ~ 'halimeda',
   TRUE ~ Substrate,
)) %>%
filter(subs_group %in% c('algal_turf', 'macroalgae')) %>%
group_by(Year, site, Transect, lat, long, depth, subs_group) %>%
summarise(prop=sum(proportion), .groups='drop_last') %>%
pivot_wider(names_from=subs_group, values_from=prop, values_fill=0)
```

Now, how about trying to predict benthic reef productivity by merging area specific turf productivity predicted using the data compiled by Tebbett and Bellwood and turf cover?

#### Now plotting

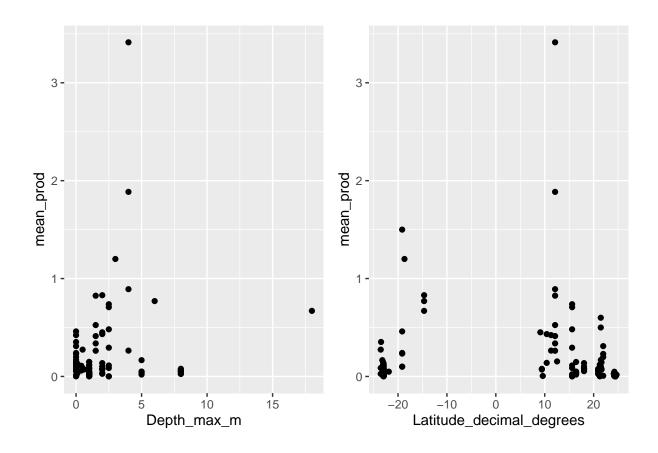

First the time series of turf productivity over time in Moorea

#### And using Duarte's et al 2022's data to explore a model for macroalgae

It could be possible to do the same for Halimeda, but there are less values

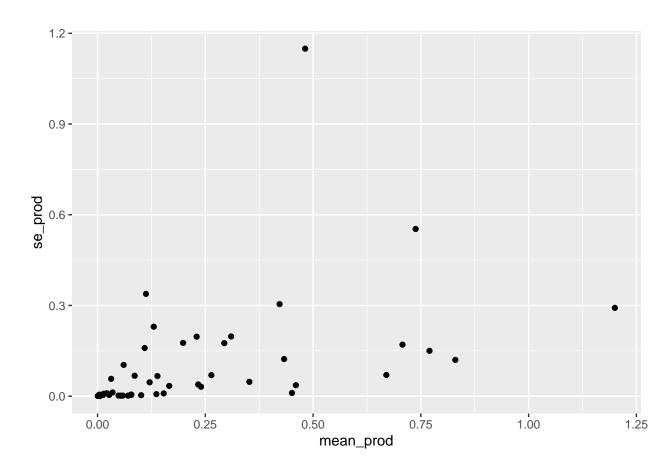

Maybe return to this possibility later?

## Get outta here, nothing useful to predict so just including variability in a meta-analysis

Can we predict standard error values from a relationship between mean and se as we did for algal turfs?

```
ggplot(dmachal %>% filter(!is.na(se_prod))) +
geom_point(aes(x=mean_prod,y=se_prod))
```

```
mod_se2 <- lm(se_prod ~ mean_prod, data=dmachal)
## Again, Model sucks, but better than to consider zero

dmachal[is.na(dmachal$se_prod),'se_prod'] <- round(predict(mod_se2, newdata=dmachal[is.na(dmachal$se_prod)))</pre>
```

#### And finally modelling macroalgae productivity using a meta-analysis

#### Bayesian model with depth as the only predictor

```

Now, how about trying to predict benthicmacroalgae productivity by merging area specific turf productivity predicted using the data compiled by Duarte et al 2022 and macroalgae cover?

#### Now plotting

First the time series of macroalgae productivity over time in Moorea

## Saving the final estimates fro Moorea

```
write.csv(fts_data,'Moorea_turf_macr_prod.csv', row.names=FALSE)
```
